Assessment market readiness and ability to compete of ERP system Agrio in German potato sector

Draft Delivery

October 17th, 2025

Executed interviews				
Interview respondent	Company	Function	Date of interview	
• Maximilian Klomp	• Böhmer	• Digitalization Developer	• 17 – 06 – 2025	executed
• Markus Henglein	• Henglein	• Managing Director Purchasing	• 21 – 07 – 2025	executed
• Lars Ording	• Golden Geest	• Managing Director	• 28 – 07 – 2025	executed
• Mathias Baetke	• Danespo	• Accounting & IT	• 30 – 07 – 2025	executed
• Andre Nadler	• Burgis	• Manager Purchasing	• 31 – 07 – 2025	executed
• Arne Rehnert	• Interseed	• Managing Director	• 06 – 08 – 2025	executed
• Theodor von Hahn	• Norika	• Managing Director	• 18 – 08 – 2025	executed
• Sebastian Dykhuis	• Emsland	• Head Production planning & Control	• 19 – 08 – 2025	executed
• Johannes Beckers	• Wilhelm Weuthen	• Head Seed Potatoes	• 25 – 08 – 2025	executed
• Marko Wunderlich	• Friweika	• Vice President	• 26 – 08 – 2025	executed
• Dirk Diering	• Fangmeier	• Manager Purchasing	• 04 – 09 – 2025	executed
• Lothar Meyer	• Pflanzkartoffel-Spezialhaus Meyer	• Managing Director	• 11 – 09 – 2025	executed
• Volker Peters	• Groka	• Managing Director	• 19 – 09 – 2025	executed

DRAFT

Interview results

Management summary

- Interviewed companies can be classified into three roughly equally represented groups:
(1) Consumption – trading & packaging, (2) Consumption – processing and (3) seed potatoes – trading
- Interviewed companies vary strongly in size (FTE, revenue and potato volume) and supply chain (amount and types of suppliers)
- Using a (Microsoft) cloud-based system is not an issue for over half of the respondents, though some of them acknowledge other colleagues may consider it an issue or express the need to for an internal data backup
- Independence & data privacy concerns are the issue for other respondents, for Interseed & Meyer it is an issue but not a deciding factor
- 5 interviewed companies use SAP for ERP, most use additional (in-house or external) software for SCM
- 5 interviewed companies use external software (Agrio, A1, Cloudflight, SW Hamburg, Winweb) for both ERP and SCM
- The remaining companies use customized in-house solutions (SIS for Golden Geest & Interseed as part of Agrarfrost group)
- Interviewed companies are generally satisfied about SAP for ERP purposes, but need for additional SCM solutions and lack of potato sector specialization are downsides
- Other in-house and external solutions meet needs well, but dependence on external service, lack of integration of growers and over-customization are downsides
- Compliance, data security, German language and facilitating client integration are qualifiers
- Detailed sector specific functionalities, ability to adjust software quickly & automated supplier integration are key deciding criteria.
- Clear & efficient ERP functions, user-friendliness & analysis capabilities are frequently mentioned secondary differentiators
- Interviewed companies generally see opportunities for Agrio to be successful in the German potato sector
- They characterize the sector as niche, old-fashioned and conservative, which brings both potential differentiation opportunities and potential barriers for success, in addition to key requirements (qualifiers)

Interview results

- Company characteristics
- (Digital) Infrastructure
- Current ERP & SCM solutions
- Buying criteria ERP & SCM solutions
- Opportunities & requirements for success Agrio in German potato sector

Interviewed companies can be classified into three roughly equally represented groups:
 (1) Consumption – trading & packaging, (2) Consumption – processing and (3) seed potatoes – trading
 Interviewed companies vary strongly in size (FTE, revenue and potato volume) and supply chain (amount and types of suppliers)

	Company characteristics				Supply chain characteristics		
Company	Company type	Size in FTE	Annual revenue	Potato volume	Own growers *	Supply from traders	# of contract growers
Böhmer	Consumption – trading & packaging	~1200	~€500 mln.	~400.000 MT	No	Yes	~400
Golden Geest	Consumption – trading & packaging	~70	~€100 mln.	~450.000 MT	Yes, ~60	Yes	A few hundred
Fangmeier	Consumption (+ seed) – trading & packaging	~45	~€50 mln.	~200.000 MT	Yes, 1 site (~500 ha)	No	~100
Wilhelm Weuthen	Consumption (+ seed) – trading & packaging	~90	~€200 mln.	~2.000.000 MT	No	Yes	~1500
Groka	Consumption (+ seed) – trading & packaging	~85	~€45 mln.	~100.000 MT	No	No	~180
Henglein	Consumption – processing	~700	~€200 mln.	~60.000 MT	No	No	~120
Burgis	Consumption – processing	~150	~€60 mln.	~30.000 MT	No	Yes	~80
Friweika	Consumption – processing	~380	~€100 mln.	~130.000 MT	Yes, 8	Yes	~25
Emsland	Consumption – processing	~1500	~€960 mln.	~2.000.000 MT	No	Yes	A few thousand
Danespo	Seed potatoes – trading	~12	~€10 mln.	~12.000 MT	Yes, ~50	Yes	Limited
Interseed	Seed potatoes - trading	~25	~€20 mln.	~30.000 MT	Yes, 1 site (~400 ha)	No	~15
Norika	Seed potatoes - trading	~125	~€50 mln.	~60.000 MT	Yes, 6	No	A few thousand
Meyer	Seed potatoes - trading	~12	~€30 mln.	~20.000 MT	No	Yes	~50

*own growers is eigen site, geen contracttelers!

Using a (Microsoft) cloud-based system is not an issue for over half of the respondents, though some of them acknowledge other colleagues may consider it an issue or express the need to for an internal data backup
Independence & data privacy concerns are the issue for other respondents, for Interseed & Meyer it is an issue but not a deciding factor

	(Digital) Infrastructure			
Company	Current data storage	# of users (% of FTE)	Current integration of growers	Attitude towards (Microsoft) cloud-based SaaS solution
Böhmer	Cloud-based	400 (~35%)	Manual (Excels, etc.)	No issue, bigger concern in the past
Golden Geest	Local servers	70 (100%)	Only own growers (not contract growers)	Issue because of independence & data privacy concerns
Fangmeier	Local servers	10 (~20%)	Manual (frequent physical site visits)	Issue because of independence concern
Wilhelm Weuthen	Cloud-based	35 (~40%)	Manual (in-house app)	No issue
Groka	Cloud-based	65 (~75%)	Integrated (Cloudflight)	No issue
Henglein	Cloud-based	20 (~3%)	Manual (Excels, etc.)	No issue
Burgis	Cloud-based	35 (~25%)	Manual (Excels, etc.)	No issue, but may differ per person
Friweika	Local servers	50 (~15%)	Manual (Excels, etc.)	Issue because of independence & data privacy concerns
Emsland	Cloud-based	30 (~2%)	Manual (in-house app)	No issue
Danespo	Cloud-based	12 (100%)	Integrated (Agrio)	No issue
Interseed	Local servers	10 (~40%)	Manual (Excels, etc.)	Issue, but not a deciding factor
Norika	Local servers	65 (~50%)	Manual (Excels, etc.)	No issue, but may differ per person
Meyer	Local servers	7 (~60%)	Requires manual input	Issue, but not a deciding factor

'I am not worried about cloud-based systems personally, and let's be honest, we use Microsoft 365 and other cloud-based systems every day. But I expect some colleagues would need extra convincing. It is a topic to be addressed.'

Theodor von Hahn, Managing Director - Norika

'For the Agrarfrost group and the companies that are part of it, independence is key. So we never want to be dependent on any external cloud or relationship to SAP or any other software company.'

Lars Ording, Managing Director – Golden Geest

'If I had to choose now between two systems and data is stored locally on one of them and the other one is in the cloud on Microsoft, then I would feel more comfortable with the option with local data storage.'

Arne Rehnert, Managing Director - Interseed

'We've just invested in a new server for €20.000, so I'm not thinking about it for the next five years. For now that is okay for us, but I know the cloud will come at some point.'

Lothar Meyer, Managing Director - Pflanzkartoffel-Spezialhaus Meyer

Veel partijen werken nog met Excel voor het bijhouden van de voorraden. Hier ligt een kans voor Agrio.

DRAFT

5 interviewed companies use SAP for ERP, most use additional (in-house or external) software for SCM

5 interviewed companies use external software (Agrio, A1, Cloudflight, SW Hamburg, Winweb) for both ERP and SCM

The remaining companies use customized in-house solutions (SIS for Golden Geest & Interseed as part of Agrarfrost group)

	Current ERP & SCM solutions			
Company	Current ERP solution	Current SCM solution	Elaboration	Satisfaction current solution(s)
Böhmer	SAP	RIWO (external)	RIWO is Oracle-based + customizations. Was designed by Böhmer employee but is not exclusive to Böhmer, it is also used by other companies.	
Golden Geest	SIS (in-house)	SIS (in-house)	SIS is an in-house intranet system for Agrarfrost Group companies including ERP, SCM and more (f.i. CRM).	 1
Fangmeier	Customized (in-house)	Customized (in-house)	Fangmeier uses 2 customized in-house solutions: 1 for ERP and 1 for SCM.	
Wilhelm Weuthen	SAP	MS Office + in-house app	Wilhelm Weuthen uses a combination of MS Office and an in-house app for SCM, growers have access to in-house app but manual input is required.	
Groka	Cloudflight (external)	Cloudflight (external)	Software supplier Cloudflight has developed and implemented a system tailored to meet Groka's needs with respect to both ERP and SCM.	
Henglein	SAP	Ebirn (external)	is a sector-specific software for Henglein and other potato companies.	
Burgis	SAP	SAP where possible	Burgis uses SAP for both ERP and SCM but acknowledges room for improvement with respect to SCM.	
Friweika	Winweb	Winweb	Switch from Microsoft Dynamics to Winweb. Implementation of Winweb will start in 2026. Too early to evaluate Winweb.	*
Emsland	SAP	SAP + in-house app	Very recent switch from Infor Blending to SAP. Too early to evaluate SAP.	*
Danespo	Agrio (Newminds)	Agrio (Newminds)	Only interviewed company to already use Newminds' product Agrio.	
Interseed	SIS (in-house)	MS Office + SIS (in-house)	Interseed uses in-house system SIS (Agrarfrost Group) for both ERP and SCM but acknowledges room for improvement with respect to SCM.	 1
Norika	A1 (Amic)	A1 (Amic)	A1 is a standard system + customizations tailored to meet Norika's needs.	
Meyer	SW Hamburg (external)	SW Hamburg (external)	SW Hamburg is a standard system + customizations tailored to meet Pflanzkartoffel-Spezialhaus Meyer's needs.	

Interviewed companies are generally satisfied about SAP for ERP purposes, but need for additional SCM solutions and lack of potato sector specialization are downsides. Other in-house and external solutions meet needs well, but dependence on external service, lack of integration of growers and over-customization are downsides

SAP	Key upsides • Clear and efficient functioning of standard ERP functionalities • Ability to collect and analyze financial data to support decision making • Facilitating cooperation and integration with rest of supply chain • Continuity, maintenance and broad choice of implementation partners	Key downsides • Incomplete with respect to SCM functionalities, need for additional manual/in-house/external solutions for complete SCM • Lack of centralization (due to reason above) • Not tailored to needs of potato sector • Dependence on external implementation partner and their service • Lack of integration of growers*
Other external ERP/SCM solutions	Key upsides • Customization to specific company needs • Compliance / ability to adapt to changes, laws and regulations in (German) market • Flexibility and ability to make changes without need for external support • User-friendliness and workforce being accustomed to how software works	Key downsides • Dependence on external implementation partner and their service • Over-customization • Lack of integration of growers* Key downsides Agrio (Danespo) • Sub-par compliance / ability to adapt to changes, laws and regulations in (German) market • Sub-par German language integration
In-house solutions	Key upsides • Customization to specific company needs • Independence of external support, suppliers or implementation partners • User-friendliness and workforce being accustomed to how software works • Local data storage & data security	Key downsides • Occasional issues in connection between different parts of accounting functionalities • Lack of automation & integration of growers with respect to SCM functionalities Note • In-house solutions generally seem more limited in functionalities than Agrio and other external solutions however this is no issue to users

'We supply to almost all big food companies and retailers in Germany and all our clients work with SAP so that is very easy to integrate'

Maximilian Klomp, Digitalization Developer- Böhmer

'It would be great if we could use only one system and not have to switch between 2 or 3 systems. That would make it much easier. At the moment we work with 2, 3 or even 4 systems, that is very complex.'

Johannes Beckers, Head Seed Potatoes – Wilhelm Weuthen

'The German localization of Agrio looks like somebody started and at some point got bored and said: that's it, I'm out of here. Half of the fields are not translated, some had misleading translations, so that's a problem'

Mathias Baetke, Accounting & IT - Danespo

'The people who created it come from a handwriting era and that is reflected by integration of the system. So people of my generation are in between worlds now. It's highly customized, probably over customized.'

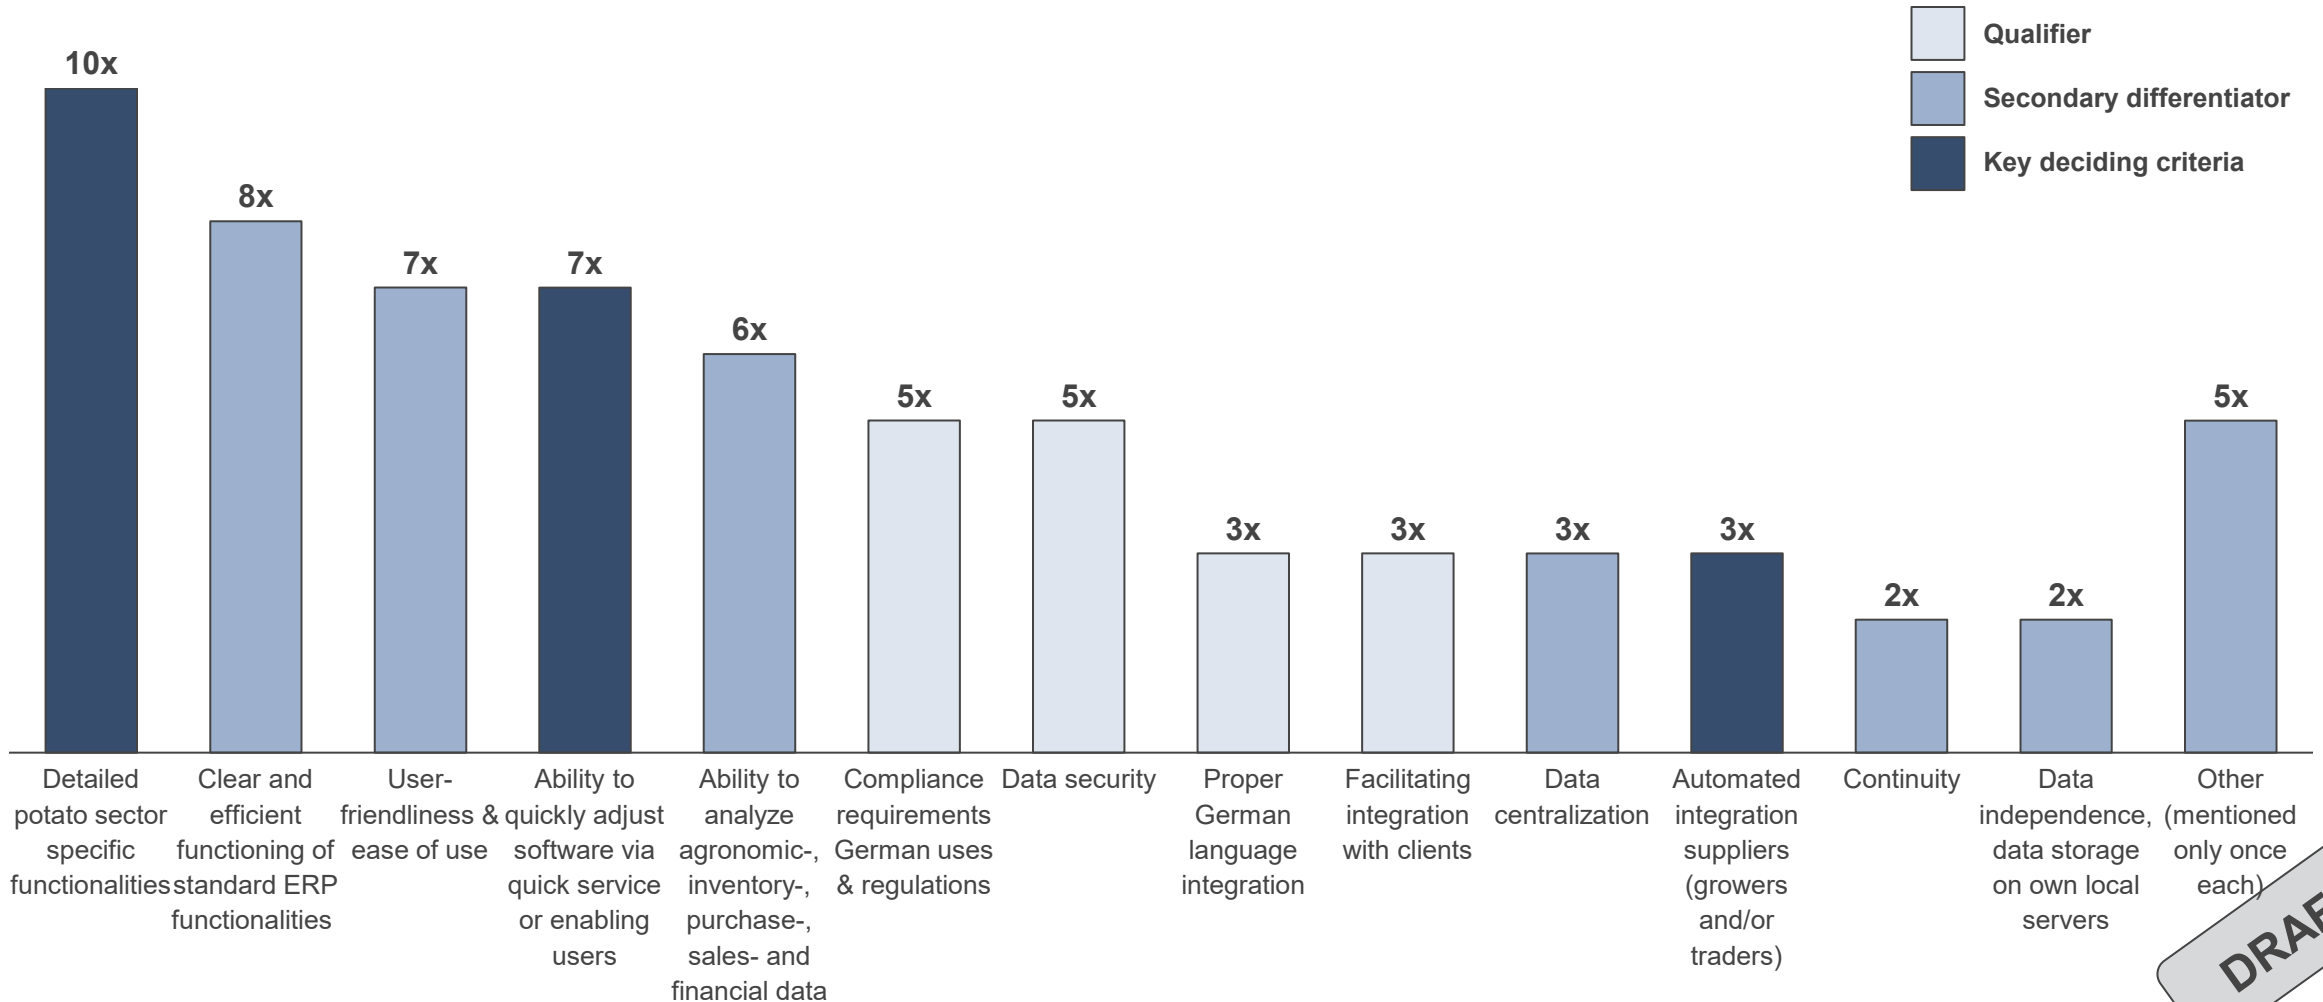

Theodor von Hahn, Managing Director - Norika

DRAFT

*Whether this is the case differs per (external) solution and several respondents without integration of growers do not consider this an issue

Compliance, data security, German language and facilitating client integration are qualifiers. Detailed sector specific functionalities, ability to adjust software quickly & automated supplier integration are key deciding criteria. Clear & efficient ERP functions, user-friendliness & analysis capabilities are frequently mentioned secondary differentiators

Buying criteria ERP & SCM solutions
(frequency mentioned across all interviews)

DRAFT

Interviewed companies generally see opportunities for Agrio to be successful in the German potato sector
They characterize the sector as niche, old-fashioned and conservative, which brings both potential differentiation opportunities and potential barriers for success, in addition to key requirements (qualifiers)

Opportunities Agrio in German potato sector in general

Interviewed companies generally see opportunities for Agrio to be successful in the German potato sector. They see the German potato sector as:

- **Niche:** the potato is a unique product so the sector has unique and specific management requirements
- **Old-fashioned:** majority of operations still go via phone calls and personal contact
- **Conservative:** reluctant to change and slow in decision making, but once decided often long term decisions.

I think it could have a chance, but a problem is we are not as digitalized in DE as in NL, so it could be a bit too much. Many growers are older and everything goes by phone. So it could be valuable in theory, but in practice I don't know.'

Theodor von Hahn, Managing Director - Norika

Potential success factors to differentiate in German potato sector

Interviewed companies see potential to differentiate from existing ERP/SCM suppliers in German potato sector in:

- Good understanding and implementation of potato sector specific requirements with respect to management of traceability, stock, quality, volumes, prices, logistics, etc.
- Continuity, maintenance and long term future perspective.
- Ability to adapt to changes quickly in the dynamic potato sector.
- Centralization of all functionalities in a single, easy to use system.

'I know many potato companies in Germany still use Excels and the like, so the new generation of young people will ask: do I still have to do this via Excel or write it down manually? Is there no automated software for it?'

Volker Peters, Managing Director - Groka

Potential barriers to success in German potato sector

Interviewed companies see potential barriers to success in German potato sector in:

- Agrio could be 'too advanced' as many operations in German potato sector still go via phone calls and personal contact and companies may be hesitant to implement as implementing Agrio will often be a big change.
- As companies in the German potato sector are generally conservative they often tend to stick to what they are familiar with and they will require a lot of time and convincing before making a decision like adopting and implementing Agrio.
- Data storage in the MS cloud could be an issue for some companies.

'If you ask if there is a market, there is a huge market. But you have to react very fast in the quickly changing potato business. If you have a software that is not fast or convenient enough to adapt to that, you will have problems.'

Lars Ording, Managing Director – Golden Geest

Key requirements (qualifiers) for success in German potato sector

Interviewed companies see the following factors as qualifiers to meet before having any chance of success in the German potato sector:

- Facilitating integration with other players in supply chain (esp. clients, who mostly use SAP)
- Compliance with German uses & regulations
- Meeting minimum data security standards
- Proper German language integration

'You often see that companies work with different systems and suppliers simultaneously to have all envisioned functionalities. So if there is a partner with a single, complete solution that would be very interesting.'

Andre Nadler, Manager Purchasing – Burgis

DRAFT

Interview results

Summaries per company

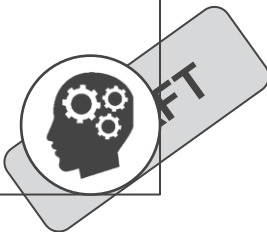

General company info & infrastructure Company type: trading & packaging (also seed potato supply and cultivation advice to growers) Size in FTE: ~1200 (Böhmer group incl. daughter companies), of which ~230 use RIWO and ~400 use SAP Annual revenue: ~€500 million (group incl. daughter companies) Potato volume: ~400.000 MT Supply chain: ~400 contract growers	Current ERP & Supply Chain Management system Böhmer uses RIWO, which is a combination of a standard and a customized system, alongside SAP, to manage ERP & supply chain. RIWO is Oracle-based with specific add-ons and customizations for Böhmer. - RIWO was initially developed by a Böhmer employee, who is still responsible for maintenance, however RIWO is not exclusively used by Böhmer but also by other companies. - Böhmer's SAP implementation partner is GQS AG. Stock management, planning, logistics, etc. are currently done via RIWO, but only includes Böhmer's own data. It does not provide any insights in stock positions, yield forecasts, etc. of the growers. Gaining insights from and planning with growers currently goes via grower consultants, using Excel sheets. More standard ERP functionalities like financial administration, orders, invoicing etc. are done via SAP. Böhmer is planning to increase the role and use of SAP and replace some of the functionalities currently done via RIWO by SAP where possible.
Opportunities Agrio in German potato sector in general A system customized to the needs and dynamics of the German potato sector including potato sector specific functionalities like quality control, logistics management, etc. could be successful in German potato sector. SAP integration is a qualifier due to many players in German potato supply chain using SAP. Data storage in the MS cloud used to be an issue for Böhmer in the past, but no longer is. It could be an issue for some companies. Key factor to be successful is continuity, maintenance and long term future perspective. German potato companies are generally quite conservative and stick to long term decisions. Böhmer made the decision to combine multiple systems to meet same functionalities Agrio has (or not even) and if they knew about Agrio 5-7 years ago they might have chosen Agrio. However unlikely to switch in next years.	Key considerations & buying criteria Data storage in the cloud (MS Azure datacenter in Frankfurt) is no issue, Böhmer is moving to cloud data storage and adoption of f.i. Microsoft One Drive and Sharepoint already. It used to be more of an issue in the past. Key considerations when selecting ERP- & SCM software are: - Facilitating cooperation and integration with rest of supply chain (majority of Böhmer's clients use SAP) - Continuity: long term sustainability and reliability with respect to maintenance, consultancy options, etc. - Customization and adaptability to comply with changes, laws and regulations in (German) market - Potato sector specific functionalities like quality control, traceability, logistics and transport management incl. external transport companies - User-friendliness & ease of use

General company info & infrastructure Company type: trading & packaging (also seed potato supply and cultivation advice to growers) Size in FTE: ~70, all using ERP/SCM software to some degree Annual revenue: ~€100 million Potato volume: ~450.000 MT, ~190.000 MT storage Supply chain: ~60 own growers + contract growers + purchase from traders	Current ERP & Supply Chain Management system Golden Geest has in-house customized, cloud-based system SIS, designed exclusively for the Agrarfrost group. SIS is used for financial administration, orders, invoicing, stock management, logistics management, quality control, etc. but also for broader functionalities like CRM. - SIS is like an intranet used by all companies in the Agrarfrost group, managed by IT department of 10-15 people. - Own growers have access as well and both provide input (field size, yield, etc.) to and retrieve insights (contract data, delivered volume, open demand in order, etc.) from the system. - Contract growers and traders can access the system but options and insights are more limited. SIS contains stock management, including stocks of own growers, but excluding contract growers. Golden Geest uses separate external forecasting systems integrated into SIS. Contracts, logistics and quality control are tailored to meet all potato sector specific needs. SIS seems to meet all needs of Golden Geest and general opinion is very positive. Only minor issues that occasionally occur are related to (connections between logistics and) accounting functionalities.
Opportunities Agrio in German potato sector in general As potatoes are such a unique product and require very specific management options for pricing, logistics, quality control, etc. there are not many existing systems meeting these specifications. If Agrio does meet these specifications then they have a good chance to be successful in the German market. Another important required feature is the ability to adapt to changes quickly as the potato sector is a dynamic environment and it is key for ERP/SCM software to keep up with changes. Data storage in the MS cloud could be an issue for some companies. Chances of success for companies part of Agrarfrost group are considered small, however for other companies it could be very interesting.	Key considerations & buying criteria Data storage in the cloud (MS Azure datacenter in Frankfurt) is an issue, as independence and data privacy are considered very important. Preference to keep everything inside the Agrarfrost group. Key considerations when selecting ERP- & SCM software are: - Potato sector specific contract management and logistics management - Ability to integrate, gain insight into and use agronomic data - Ability to adapt to changes and implement adjustments into the software quickly - Integration of other stakeholders in the supply chain (growers, traders, processors, etc.) - Independence (in this case for the Agrarfrost group)

General company info & infrastructure Company type: trading & packaging (mostly for potato chips industry) Size in FTE: ~45, of which ~10 use ERP/SCM software Annual revenue: ~€50 million Potato volume: ~200.000 MT Supply chain: ~100 contract growers + 1 large own site (500 ha)	Current ERP & Supply Chain Management system Fangmeier uses two completely customized, in-house solutions to manage ERP and supply chain built by an implementation partner (one-man business) who works exclusively for Fangmeier. - The most important functionality of the SCM system is high level of detail for each lot with respect to quality, variety, volume, etc., including loading of quality samples into the system and automatically classifying samples for further ERP & SCM purposes. - The most important functionalities of the ERP system are invoicing and connecting purchases and sales. Fangmeier takes samples at the fields of all their (contract) growers frequently themselves and then enters the samples as input in their SCM system, meaning automated integration of stock management, quality management and yield forecasts from the growers are not a demand for Fangmeier. They prefer to physically visit all potato fields every 4 weeks and enter data manually as the variety and quality of the potato are so crucial for the potato chips industry. Overall, Fangmeier is a relatively small player in the German potato sector with a specific focus on trading potatoes for the potato chips industry. As their core business is very niche, so are their demands for ERP and supply chain management. Most of the functionalities and benefits of Agrio seem redundant to Fangmeier.
Opportunities Agrio in German potato sector in general Respondent emphasizes he can only speak for the very niche potato chips industry. From that perspective, he doubts the potential for success of Agrio. Key grounds for these doubts are the limited size of the market, limited number of players and the unique practices. This leads to a preference for local data storage over a cloud-based solution and requiring lots of personal contact and manual labor, most of which cannot be automated in a software solution. In conclusion, respondent believes Agrio can be successful in the German potato sector, but at different types of companies with less niche activities and larger volumes. Fangmeier believes the best way to run its business is with lots of personal contact and manual labor. There is no need for automation with respect to ERP and supply chain management.	Key considerations & buying criteria Data storage in the cloud (MS Azure datacenter in Frankfurt) is an issue for Fangmeier. They prefer local data storage and even physical documents over a cloud-based solution. Key considerations when selecting ERP- & SCM software are: - High level of detail in quality management - Clear and efficient functioning of standard ERP functionalities like contract management, orders, invoicing, etc. - Flexibility and ability to adapt quickly to changes in the market - Immaculate applicability of functionalities on mobile phone, preferably via Whatsapp

General company info & infrastructure Company type: trading & packaging (both consumption potatoes & seed potatoes) Size in FTE: ~90, of which ~30-40 use ERP/SCM software Annual revenue: >€200 million Potato volume: ~2.000.000 MT Supply chain: ~1.500 contract growers + purchase from traders	Current ERP & Supply Chain Management system Wilhelm Weuthen uses SAP to manage ERP and a combination of standard Microsoft applications (Excel, Windows accessoires) and an in-house app to manage their supply chain. Growers also use this app. Decisions about ERP/SCM software, implementation partners, etc. are made by the RWZ group that Wilhelm Weuthen is part of. Wilhelm Weuthen is not authorized to switch or add ERP/SCM software, even if it would want to. • SAP is strictly used for ERP functionalities, not for supply chain management and not involving growers. • Wilhelm Weuthen tried to do planning of seed potato chain with SAP, but it didn't work due to lack of flexibility. • To get insights from growers about stock, forecasts, etc. growers provide manual input via in-house app. Every data point retrieved by growers about stock, volumes, planning, etc. makes work easier. Currently this is not complete and consistent due to dependence on manual input by growers. Wilhelm Weuthen is interested in all the functionalities and benefits of Agrio like optimized supply chain management tailored to the potato sector, including (stocks, yield forecasts and planning of) growers. The idea of a single automated system for all ERP & SCM functionalities also sparks interest, but RWZ would be decision maker and their interests go far beyond potato supply chain management as they have companies in many different industries.
Opportunities Agrio in German potato sector in general Agrio has a lot of potential to succeed in the German potato sector if they are really able to combine all the specific requirements for managing the potato supply chain in one easy to handle ERP system. Providing flexibility for users to find their own preferred, optimal way of working within the system is a big plus. Full German language integration is a very important qualifier. Finally, to be successful the system must be able to co-exist alongside and work well together with SAP as SAP is used at many German potato companies and if companies adopt Agrio in many cases it is likely to be added in addition to SAP rather than replacing it. Automation and centralization of functionalities can provide an important USP, as well as a good implementation and training of users.	Key considerations & buying criteria Data storage in the cloud (MS Azure datacenter in Frankfurt) is not an issue for Wilhelm Weuthen. They already use cloud-based Microsoft applications like Sharepoint, Teams, etc. Key considerations when selecting ERP- & SCM software are: • Flexibility, having the freedom to make any required changes in any part of the system at any point in time • Adaptability and customization possibilities, preferably also for users themselves • Centralization, needing only 1 system rather than 3 or 4 different systems would be experienced as big upgrade • Potato sector specific functionalities incl. dealing with varying volumes, stocks, qualities, prices, contracts etc. • Cybersecurity, should meet data security standards to qualify • Ability to analyze purchase, inventory, sales data and share data & analyses easily

General company info & infrastructure Company type: trading & packaging (both consumption potatoes & seed potatoes) Size in FTE: ~85, of which ~65 use ERP/SCM software Annual revenue: ~€45 million Potato volume: ~100.000 MT Supply chain: ~180 contract growers (potatoes only, excl. onions)	Current ERP & Supply Chain Management system Groka uses a customized, cloud-based solution to manage ERP and supply chain. This customized system is designed, developed and supplied by internationally operating, German software supplier Cloudflight (https://www.cloudflight.io/). • Cloudflight supplies ERP software to a wide array of industries and companies • Their customized solution for potato trading & packaging is currently only used by Groka, however there are two more companies (Böhmer a.o.) interested and reportedly in talks with Cloudflight to purchase and implement it. Yield forecasting and planning at the grower level are very important to Groka and can be completely managed within their system from seed potato to processing towards consumption potato and delivery to retail. Stock management is also important, but not at the grower level, as all storage takes place at Groka. The complete supply chain (origin, volume, quality, variety, transport, storage, delivery, etc. of each lot of potatoes is managed in the system from grower to Groka itself to their clients. The planning is based on yield forecasts and adjusted for actual events and results.
Opportunities Agrio in German potato sector in general Possibility to smoothly work together with ERP systems used by other players in the German potato supply chain is a qualifier, regardless of which system is used. However, many players use SAP. Agrio has a lot of potential to succeed in the German potato sector if they are really able to combine all the specific requirements for managing the potato supply chain in one easy to handle ERP system. There is a lot of room for improvement with respect to centralization and automation of ERP & supply chain management functionalities in the German potato sector, as many companies in the German potato sector still work with Excel files or even printed document, so there should be demand for it. This can also be a strong barrier for adoption, however, as the German potato sector is generally conservative.	Key considerations & buying criteria Data storage in the cloud (MS Azure datacenter in Frankfurt) is not an issue for Groka. Their current solution is also cloud-based. Key considerations when selecting ERP- & SCM software are: • High level of detail in quality management • Potato sector specific functionalities like price management, logistics management, quality control and traceability • Facilitating cooperation and integration with rest of supply chain • Centralization of financial management, supply chain management and data storage in one system

General company info & infrastructure Company type: processing (also packaging) Size in FTE: ~700 (potato processing), ~1200 (total group), of which ~20 use ERP/SCM software Annual revenue: ~€200 million Potato volume: ~60.000 MT Supply chain: ~120 contract growers + purchase from traders	Current ERP & Supply Chain Management system Currently using software called Ebirn since 2024. Used for financial administration, orders, invoicing, stock management, logistics management, etc. and has integration with SAP which Henglein also uses. - Ebirn is delivered directly by the company and is customized to Henglein's (potato processing) needs. - For SAP they have 2 in-house consultants (Henglein employees) but also several SAP implementation consultants, mostly several small regional ones (1-5 employees) and Prismat as large implementation consultant. Stock management of growers is based on contracts and input from growers, but no real-time data or automation. Doubts about inclusion growers in automated system due to age and lack of digital skills among growers. Price details and rules are completely customized to manage prices specifically for practices Henglein and provide management options and insight in detail, to order and even truck level.
Opportunities Agrio in German potato sector in general SAP integration is a qualifier due to many players in German potato supply chain using SAP. System with specific design to manage potatoes (quality control, volumes, prices, logistics, etc.) is interesting but there are German competitors with similar features. Main USP would be integrating total supply chain incl. growers (and traders), however for Henglein not a deciding factor and for successful implementation in German potato sector there are doubts about suitability as many potato growers in Germany are relatively old and lack digital skills while traders may not always be transparent. Orders in the German potato supply chain usually go via phone and this is unlikely to change short term, but perhaps it will change in 10+ years and then there would be higher demand for a system like Agrio.	Key considerations & buying criteria Data storage in the cloud (MS Azure datacenter in Frankfurt) is no issue, Henglein currently also stores data in cloud. Key considerations when selecting ERP- & SCM software are: - Easy, efficient, automated standard ERP functionalities like orders, invoices, contracts, etc. - Potato sector specific functionalities like price management, logistics management, quality control and traceability - Ability to analyze purchase, inventory, sales data to support decision making - Support service with high availability and ability to meet customization demands quickly - Cybersecurity, has to comply with NIS - User-friendliness & ease of use - Customizability to company's own demands & needs

General company info & infrastructure Company type: processing (also packaging) Size in FTE: ~150, of which ~35 use ERP/SCM software Annual revenue: ~€60 million Potato volume: ~30.000 MT Supply chain: ~80 contract growers + minor purchase from traders	Current ERP & Supply Chain Management system Burgis uses SAP to manage ERP & supply chain in a combination of a standard system with customized add-ons for Burgis. SAP was implemented 3 years ago. • Key functionalities include contract management, orders, planning, invoices and quality control. • Most customizations are done by a few key users (Burgis employees). • Burgis also has a SAP consultant, but the respondent hardly works with them and does not know the name. Stock management of growers is based on contracts and input from growers via phone, e-mail and Excel files, but no real-time data or automation. Burgis would love ability to integrate data from growers into integral, automated system and even though a small minority would lack digital skills this is no red flag and would ben very beneficiary. SAP is considered a useful system that meets all standard ERP needs. It is not the perfect solution but it gets the job done. Data analysis and data traceability in SAP are considered key advantages. The rigidity (difficult to adapt to needs and changes) and the complexity of SAP (esp. for new, less experienced users) are considered disadvantages.
Opportunities Agrio in German potato sector in general SAP integration is a qualifier due to many players in German potato supply chain using SAP. System with specific design to manage potatoes (quality control, volumes, prices, logistics, etc.) would differentiate from many less potato sector specific solutions in available in the German market. Besides potato sector specificity, the integration of grower data within an automated system would be another key USP. Data storage in the MS cloud would not be an issue for respondent, but he acknowledges it is a concern in Germany and could be an issue for some companies. Generally, chances for Agrio in German potato sector are considered positive, but it may be hard to convince companies to switch as they are often used to large standard systems and may be reluctant to change.	Key considerations & buying criteria Data storage in the cloud (MS Azure datacenter in Frankfurt) is no issue, Burgis currently also stores data in cloud. Respondent acknowledges it is a concern in Germany so it may differ for different people and different types of data Key considerations when selecting ERP- & SCM software are: • User friendliness & ease of use • Clear and efficient functioning of standard ERP functionalities like contract management, orders, invoicing, etc. • Ability to analyze purchase, inventory, sales data to support decision making • Connecting data of growers with data of company by automating data exchange from and to growers • Ability to adapt to changes and implement adjustments into the software quickly (less rigid than SAP) • Cybersecurity, should meet data security standards to qualify

General company info & infrastructure Company type: processing (also packaging) Size in FTE: ~380, of which ~50 use ERP/SCM software Annual revenue: ~€100 million Potato volume: ~130.000 MT Supply chain: 8 own growers (who are also shareholders) + 25 contract growers + purchase from traders	Current ERP & Supply Chain Management system Friweika uses Microsoft Dynamics to manage ERP & supply chain. ERP functionalities are standard and many customizations have been implemented to meet Friweika's needs and make supply chain management possible. These customizations were programmed by implementation partner BE-terna. Microsoft Dynamics meets most requirements, however (financial) data analysis can be complicated with room for improvement in convenience and simplicity. Friweika recently purchased German-made ERP system Winweb to replace Microsoft Dynamics, which will be implemented starting January 2026. As implementation did not happen yet, no experiences about Winweb could be shared. However, key purchase considerations were data storage on local servers and increasing flexibility by limiting customizations (their version of Microsoft Dynamics was over-customized) while keeping all used functionalities. Contracts between Friweika and growers are not based on volumes but on area (ha) and they purchase whatever yield comes out of the area. Insights in stock of the growers and yield forecasts would be nice to have but no more than that and far from a deciding factor. Stock management at company level is key and suffices. Friweika manages based on current situation rather than forecasts.
Opportunities Agrio in German potato sector in general Respondent considers it difficult to estimate whether Agrio could be successful in German potato sector. From their perspective as a processor and packager of fresh potatoes, they feel other systems can meet all their ERP & supply chain management needs. The potato sector specific functionalities of Agrio are considered nice to have but not decisive, however they acknowledge this may be different for companies with a different profile (f.i. seed potato companies). A key factor for Friweika is data storage on own local servers rather than in a cloud, esp. if it then ends up in another country, however they only feel like speaking for themselves and cannot say whether this also applies for other companies in the German potato sector.	Key considerations & buying criteria Data storage in the cloud (MS Azure datacenter in Frankfurt) is an issue. As Microsoft will no longer support the local server version Friweika has, they would have to move their data to the cloud in the USA. Friweika prefers to store its data locally on own servers, hence the decision to replace Microsoft Dynamics with Winweb at the turn of the year. Key considerations when selecting ERP- & SCM software are: • Data security & independence, data storage on own local servers • Clear and efficient functioning of standard ERP functionalities like contract management, orders, invoicing, etc. • Ability to collect and analyze financial data (costs, revenues, margins, etc.) to support decision making • User-friendliness & ease of use

General company info & infrastructure Company type: processing Size in FTE: ~1500, of which ~30 use agri module of ERP/SCM software (likely expanded to more users in future) Annual revenue: ~€960 million Potato volume: ~2.000.000 MT Supply chain: a few thousand contract growers + purchase from traders	Current ERP & Supply Chain Management system Emsland uses SAP S/4HANA to manage ERP & supply chain since a very short time. They are only in the kickoff stage of the implementation. Before S/4HANA they used a very customized version of Infor Blending. • Main reason to abandon Infor Blending was discontinuation of their version of Infor Blending. • Main reason to switch to S/4HANA was market evaluation together with implementation partner NTT who have experience with S/4HANA and also a best practice model for the agricultural sector. • To get insights from growers about stock, forecasts, etc. growers provide manual input via in-house app. Key functionality that was a requirement for Emsland they did not have before S/4HANA is the integration of financial aspects (most importantly contracts and orders of growers) in the management of the rest of the supply chain. Emsland plans to integrate the growers more automated and centrally in the future as currently the input from growers in the in-house app is completely separated from the ERP system. As the implementation of S/4HANA only just started, this is currently only a future wish and does not function yet. Emsland had stock management and yield forecasts of growers in Infor Blending, but this was too standardized to work properly for their business. They hope to manage this better with S/4HANA but it is too early to tell whether they will be able to.
Opportunities Agrio in German potato sector in general Agrio has a lot of potential to succeed in the German potato sector if they are really able to combine all the specific requirements for managing the potato supply chain in one easy to handle ERP system. Key is finding the sweet spot between including all potato sector specific functionalities while standardizing enough to avoid over-complication. Also, to be successful the system must be able to co-exist alongside and work well together with ERP solutions of suppliers and customers. Finally, respondent acknowledges the added value and importance of key functionalities of Agrio like stock management and yield forecasts at growers, however to Emsland this is more nice to know. The expectation is that across other types of German potato companies, like seed potato companies, these functionalities are considered more crucial and thus chance of success for Agrio will be higher.	Key considerations & buying criteria Data storage in the cloud (MS Azure datacenter in Frankfurt) is no issue, Emsland is moving to a completely cloud-based solution in SAP S/4HANA. Key considerations when selecting ERP- & SCM software are: • Clear and efficient functioning of standard ERP functionalities like contract management, orders, invoicing, etc. • Potato sector specific functionalities like planning, quality control, traceability, logistics and transport management at a very detailed level as each individual order is different (in price, volume, quality, timing, etc.) • Compliance with German legal changes, regulations and market dynamics • Centralization of financial management, supply chain management and data storage in one system • User-friendliness & ease of use and standardization up to the point of at least avoiding over-complication • Connecting interfaces with ERP solutions of suppliers and more importantly customers

General company info & infrastructure Company type: trading (seed potatoes) Size in FTE: ~12, all using ERP/SCM software to some degree Annual revenue: ~€10 million Potato volume: ~12.000 MT seed potatoes Supply chain: ~50 own growers + minor purchase from external growers + minor purchase from traders	Current ERP & Supply Chain Management system Danespo uses Agrio from Newminds for ERP & SCM, which was imposed by mother company in Denmark. Before using Agrio, Danespo used German ERP system A1 which is also tailored for agricultural companies. • Danespo received software and service directly from A1, the system similar functionalities to Agrio (also combining standard ERP functionalities with potato sector specific ones) but a different look and feel. • A1 is a combination of a large standard system with some customized reporting and lots of freedom for the user to customize to their own needs and demands. A key difference between A1 and Agrio is that A1 is German-made and thus complying perfectly with German regulations, changes in the market, etc. whereas Agrio does not. Examples are f.i. settlements of claims and liabilities and processing of electronic invoices the right way, complying with German law. The adaptability and possibilities to customized by users was also considered a strong advantage of A1 over Agrio. The maintenance, continuity, and aligning with MS Business Central developments are considered the main advantage of Agrio over A1. Overall, the compliance with German market dynamics and legal changes and the adaptability and freedom to customize of A1 are considered more important than the advantages of Agrio.
Opportunities Agrio in German potato sector in general Agrio has potential to succeed in the German potato sector, but they will need to improve in several areas to do so. First and foremost, the system should comply with German legal changes, regulations and market dynamics to qualify. Secondly, adaptability, agility and speed of service should increase. Thirdly, Agrio needs a proper German version without missing or confusing translations. According to the Danespo respondent, a dedicated Agrio developer for the German market could resolve this issue. Integrating total supply chain incl. growers could be a USP but is less relevant to Danespo as they do not have their own storage and only trade. Furthermore there are doubts about feasibility due to independence and lack of digital skills of growers.	Key considerations & buying criteria Data storage in the cloud (MS Azure datacenter in Frankfurt) is no issue, was never an important consideration. Key considerations when selecting ERP- & SCM software are: • Compliance with German legal changes, regulations and market dynamics • Potato sector specific stock and logistics management • Standard ERP functionalities qualifying in terms of completeness, functionality, efficiency • Adaptability and customization possibilities, preferably also for users themselves • Interface with Webseed and regional potato testing authorities • Proper German localization and documentation

General company info & infrastructure Company type: trading & breeding (seed potatoes) Size in FTE: ~25, of which ~10 use ERP/SCM software Annual revenue: ~€20 million Potato volume: ~30.000 MT Supply chain: ~15 contract growers + 1 large own site (400 ha)	Current ERP & Supply Chain Management system Interseed has in-house, customized system SIS, designed exclusively for the Agrarfrost group. However, Interseed is not obliged to use SIS by the Agrarfrost group, has considered Agrio in the past and may consider Agrio in the future. SIS is used for financial administration, orders, invoicing, stock management, logistics management, quality control, etc. but also for broader functionalities like CRM. - SIS is like an intranet used by all companies in the Agrarfrost group, managed by IT department of 10-15 people. - SIS contains all ERP & SCM functionalities for Interseed itself, but input from growers comes from Excel sheets. SIS contains stock management, including stocks of growers, however this is all based on input from Excel sheets provided by growers and inserted into the system manually. Contracts, logistics, orders and invoices are managed via SIS and meet the requirements of the seed potato very well. Planning of prices, volumes, forecasts, etc. are currently done via Excel and Interseed would like to do this in a more automated way. They are aware that Agrio has these functionalities, however they have doubts about feasibility due to the complexity of it. SIS has trouble connecting purchases and sales. A solution would be nice, but not very important.
Opportunities Agrio in German potato sector in general Agrio has potential to succeed in the German potato sector if they are really able to combine all the specific requirements for managing the potato supply chain in one easy to handle ERP system. Planning and forecasting tailored to the potato sector would be the strongest USP over the software the respondents at Interseed are familiar with. To be successful, Agrio also needs to ensure compliance with all international and specifically German practices and regulations. A challenge is likely that people and companies in the German potato sector are generally pretty conservative. So they would really need some convincing to move away from a system that they been using for years and that they are used to, even if another system outclasses it in terms of performance and functionalities. Realizing such changes usually takes a lot more time than in the Netherlands.	Key considerations & buying criteria Data storage in the cloud (MS Azure datacenter in Frankfurt) is not a key deciding factor but would be a consideration. If Interseed has to choose between two otherwise equal solutions, they would choose the one with local data storage. Key considerations when selecting ERP- & SCM software are: - Data security (internal data back-up is a requirement) & independence (would not choose a supplier at risk of being taken over in the next years, meaning data could end up at another company, possibly with conflicting interests) - Continuity: long term sustainability and reliability with respect to maintenance, consultancy options, etc. - Support service with high availability, quick response time and ability to meet demands quickly - Fluent international invoicing incl. automated VAT tariffs and compliance with other governmental regulations - Ability to collect and analyze yield data to make forecasts and support decision making - Ability to manage pool pricing in a reliable, automated way - User-friendliness & ease of use

General company info & infrastructure Company type: trading & breeding (seed potatoes) Size in FTE: ~125, of which ~60-70 use ERP/SCM software Annual revenue: ~€50 million Potato volume: ~60.000 MT seed potatoes (+ ~10.000-20.000 MT ware potatoes) Supply chain: a few thousand contract growers + 6 own growers	Current ERP & Supply Chain Management system Norika uses A1 from German software supplier Amic. A1 is a combination of a large standard system with customizations tailored for the agricultural industry. Norika buys directly from Amic but they have a (small, local) external service partner to provide additional service as Amic's support service is often very slow. Norika currently uses A1 on-premise with no timeline for cloud integration yet. It is not integrated throughout daughter companies, who decide independently as long as they are not fully convinced of a system meeting their needs. Norika acknowledges the flaws of A1 and is open minded about a potential ERP/SCM system switch. However, they are unlikely to switch very soon due to other short-term priorities and, for Agrio specifically, they do not want to be a test subject for implementation in Germany. Norika already has an impression of Agrio and their key takeaways are: • Agrio is well suited for the potato sector and has an answer for many of Norika's sector-specific problems. • There are still doubts about the integration of uses, practices, regulations, etc. applying to Germany in particular. Advantages of Agrio over A1 would be gaining a full warehouse level view on growers, more accurate (seed)lot management, better yield forecasts and stock management at growers. In summary, the ability to better manage the supply chain plus better data control & analysis, faster support service and no over-customization.
Opportunities Agrio in German potato sector in general The German potato sector is generally conservative but slowly starting to move (a.o. to more cloud-based systems). Data security and protection are important qualifiers in Germany. Many German firms would likely be reluctant If data ends up in a data center in the USA. Besides that, if a ERP/SCM system is able to meet needs and add value that other systems can't add, it has a good reason to be in the market. Full German language integration is a very important qualifier as many people feel less comfortable in English, esp. in the agricultural sector. Finally, the implementation is key. To be successful in the German potato sector, Newminds should not only sell a good system, but a good experience and way of working. If implementation is executed well and clients are taught how to work more efficiently and optimize practices and processes, Agrio has a good chance of success.	Key considerations & buying criteria Data storage in the cloud (MS Azure datacenter in Frankfurt) is not an issue for respondent personally, however he considers an internal data back-up a requirement and expects some colleagues may have more issues with it. Key considerations when selecting ERP- & SCM software are: • Accurate (seed)lot management incl. accurate and detailed product allocation (variety, quality, volume, grower, origin, destination, etc. per lot) • Proper language packages at least for German, but preferably more languages like French, Polish and Ukrainian • Clear and efficient functioning of standard ERP functionalities like contract management, orders, invoicing, etc. • More accurate stock insights and forecasts of growers, less dependent on manual input by growers • Planning functionalities meeting all needs, incl. matching stock to orders in an optimal way • The ability to not only provide possible functionalities but also active assistance, f.i. for making proposals • Feedback from other companies, willing to pay more for better quality if confident in (proven) benefits

General company info & infrastructure Company type: trading (seed potatoes + some consumption) Size in FTE: ~12, of which ~7 use ERP/SCM software Annual revenue: ~€30 million Potato volume: ~20.000 MT seed potatoes (+ ?* MT ware potatoes) Supply chain: ~50 contract growers (consumption potatoes) + supply from ~20 traders (seed potatoes)	Current ERP & Supply Chain Management system Pflanzkartoffel-spezialhaus Meyer uses software from SW Hamburg (www.sw-computer.de/) to manage ERP and supply chain. SW Hamburg created a combination of their standard ERP software complemented by customizations specifically designed for Pflanzkartoffel-spezialhaus Meyer. • Meyer receives software and service directly from SW Hamburg and data is stored on local servers. • Meyer has been using this software for 20 years and thus customizations have evolved and developed over time, while implementation and use of this software is fully integrated among their workforce. All regular ERP functionalities from orders to deliveries to invoices are managed via this software, as well as all supply chain management functionalities from stock and quality management to planning and logistics. Meyer also has insights in the stock and supply of their growers, however this input has to be entered in the system manually. In general, Meyer is very satisfied with the product and service of SW Hamburg and does not see any reason to change their ERP & supply chain management software. The only weakness mentioned is that flexibility of the software could be improved as it is complicated to repair mistakes after making them, esp. in planning and logistics.
Opportunities Agrio in German potato sector in general Respondent considers it difficult to estimate whether Agrio could be successful in German potato sector. From their perspective as a trader of seed & consumption potatoes, they feel other systems can meet all their ERP & supply chain management needs. The potato sector specific functionalities of Agrio, especially including the stock and yield forecasts of growers are considered mostly relevant for consumption potatoes and not so much for seed potatoes as Meyer gets most of its seed potato supply from other traders rather than growers. Besides data security, respondent considers good quality management, transparency and traceability key to be successful to meet all the standards of the German retail. Ultimately, respondent has the feeling that current systems used by packagers are more often outdated and in need of improvement, so more opportunities may be there.	Key considerations & buying criteria Data storage in the cloud (MS Azure datacenter in Frankfurt) is not a strong red flag and Meyer acknowledges it will probably be the norm in the future. However currently and in the next few years local data storage is still preferred. Key considerations when selecting ERP- & SCM software are: • High level of detail in (seed)lot management incl. accurate stock and quality management, planning & logistics per order / delivery • Clear and efficient functioning of standard ERP functionalities like contract management, orders, invoicing, etc. • Cybersecurity, should meet data security standards to qualify • Ability to adapt to changes and implement adjustments into the software quickly • Proper German language package • User-friendliness & ease of use

*Not open to share exact volume (~20.000 MT seed potato volume came up spontaneously during conversation)
